Introduction to Software Engineering

Building Software

Non-trivial Software is generally Build using Build Automation Systems.

Build Automation

• The goal of a Build Automation System is to **fully automate all steps** required to build the product given the source artifacts of the project.

The result of the build should always be the same - independent of the developer's local configuration.

"We want stable builds."

The Build Automation Systems is responsible for automatically carrying out all steps necessary to build the product.

- A Build Automation typically executes the following tasks:
 - Formatting the source code
 - Code Generation
 - Source Code Compilation
 - [if necessary] Linking Code/Packaging Code
 - Running the tests
 - Running static analysis tools
 - Deployment to the test system/production system(s)
 - Creating and publishing documentation, release notes, web pages, ...

Historically

Build Automation

 Given a Build Automation System, the product can be built:

- On-Demand
 (e.g., by a developer)
- Scheduled by a build server (e.g., every night)
- Triggered

 (e.g., on every commit to a version control system)

```
import AssemblyKeys._
name := "BugPicker"
version := "1.1.0"
                             Version
                           Information
scalaVersion := "2.11.4"
scalacOptions in (Compile, doc) := Seq("-deprecation", "-feature", "-unck
                                                                          Compiler Settings
scalacOptions in (Compile, doc) ++= Opts.doc.title("OPAL - BugPicker")
% "1.0.0-R8"
                                                                 Project Dependencies
jfxSettings
                                    Project Settings
JFX.addJfxrtToClasspath := true
JFX.mainClass := Some("org.opalj.bugpicker.BugPicker")
assemblySettings
                                                            Deployment information
jarName in assembly := "bugpicker-" + version.value + ".jar"
test in assembly := {}
mainClass in assembly := Some("org.opalj.bugpicker.BugPicker")
resourceGenerators in Compile <+= Def.task {</pre>
                                               Generation of other
                                                                        " / "classes" / "org" /
val versionFile = (baseDirectory in Compile).v
                                                     Artifacts
"opalj" / "bugpicker" / "version.txt"
versionFile.getParentFile.mkdirs()
```

Easily hundreds of lines for larger projects.

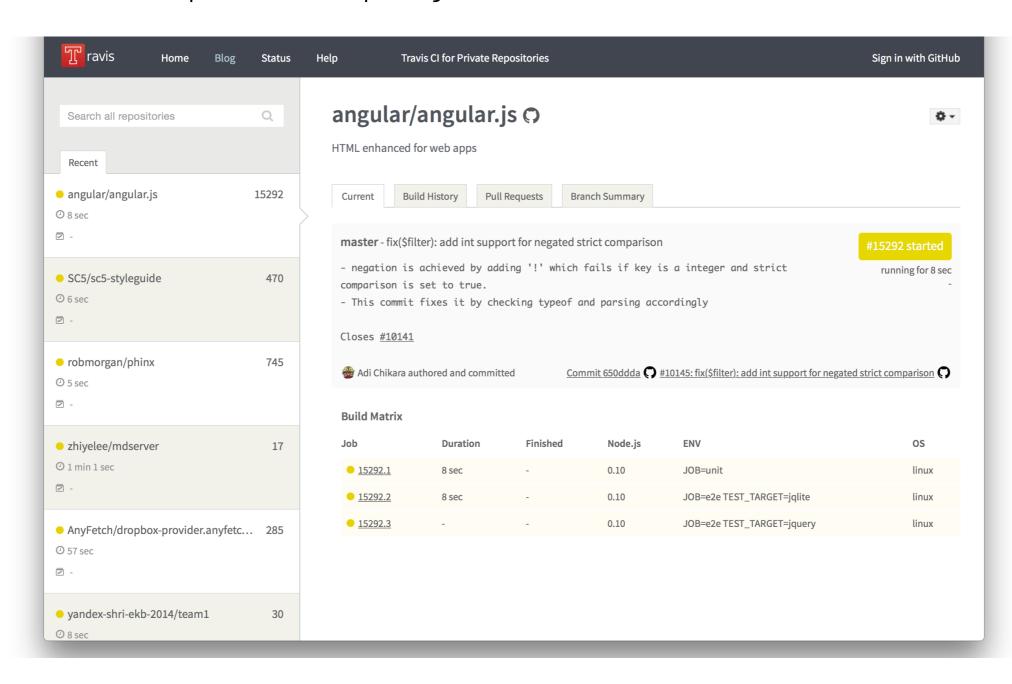

- Continuous integration basically just means that the developer's working copies are synchronized with a shared mainline several times a day.
 - It was first named and proposed by Grady Booch.
- The goal is to avoid integration issues.
- Cl is in particular useful in combination with automated unit tests.
- In practice a special build server is used. (e.g., Hudson/Jenkins)

Maintain a code repository

Continuous Integration - Best Practices

- Automate the build
- Make the build self-testing
- Everyone commits to the baseline every day
- Every commit (to baseline) should be built
 One commit one feature; no "Mega-commits"
- Keep the build fast
- Test in a clone of the production environment
- Make it easy to get the latest deliverables
- Everyone can see the results of the latest build
- Automate deployment

 A hosted continuous integration service for open source and private projects.

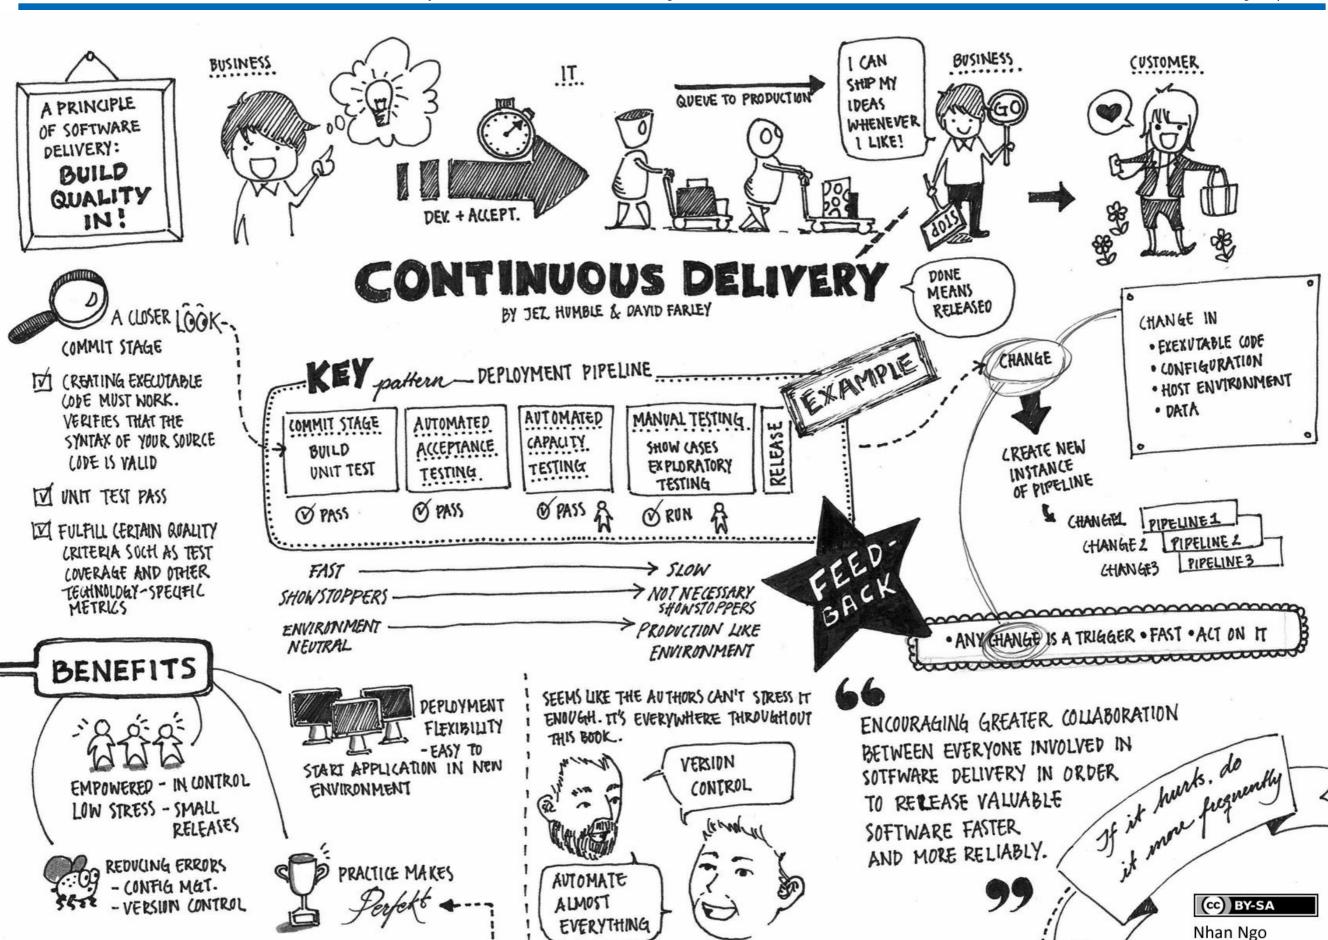

- Always be able to put a product into production (The evolution of continuous integration.)
- Practices
 - Unit/Acceptance-tests
 - Code coverage and static analysis
 - Deployment to integration environment
 - Integration tests

Continuous Delivery

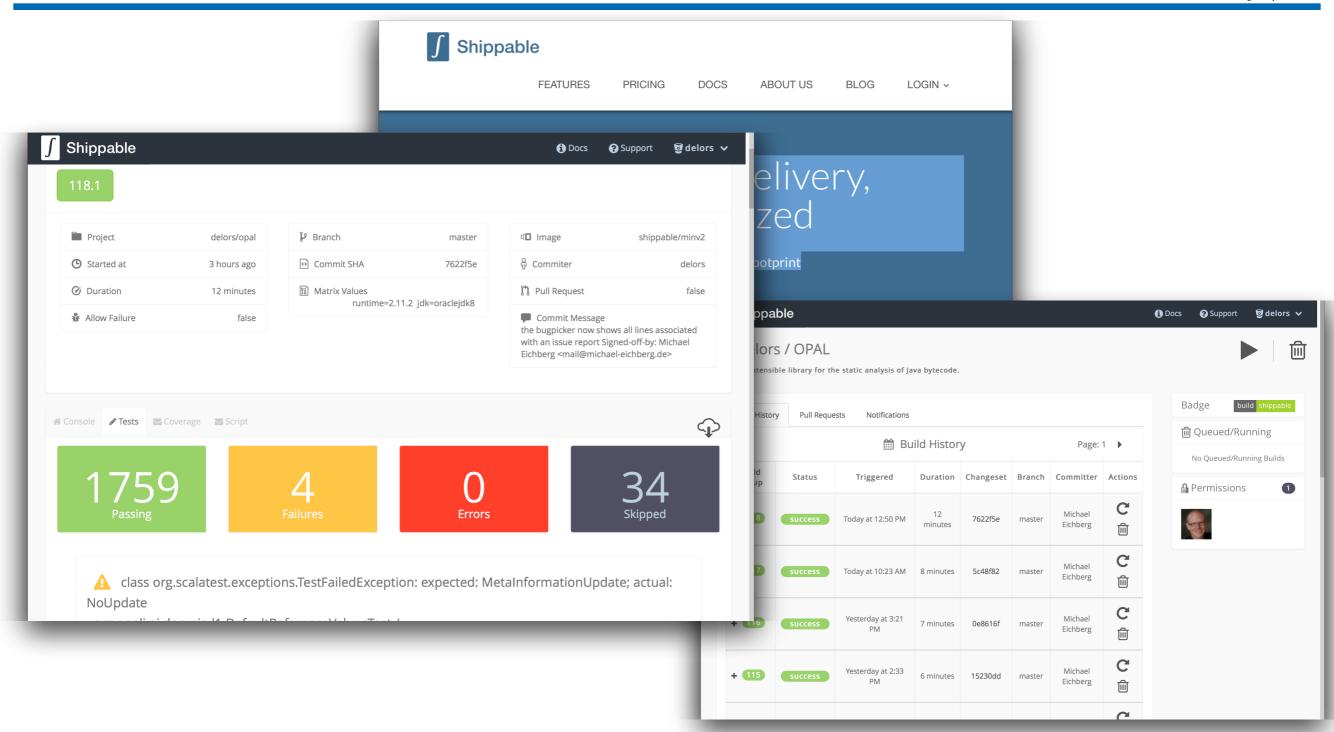

- Deployments to Performance test environment
- Performance tests
- Alerts, reports and Release Notes sent out
- Deployment to release repository

Cloud Services for Continuous Delivery

Continuous Delivery | 13

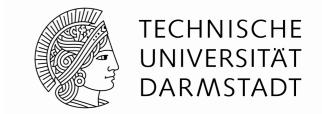

Continuous Deployment

- Automatically deploy the product into production whenever it passes QA.
 - (The logical next step after Continuous Delivery)
- The release schedule is in the hans of the It (With Continuous Delivery the release schedule is in the hands of the business.)

Attention: Sometimes the term "Continuous Deployment" is also used if you are able to continuously deploy to the test system.

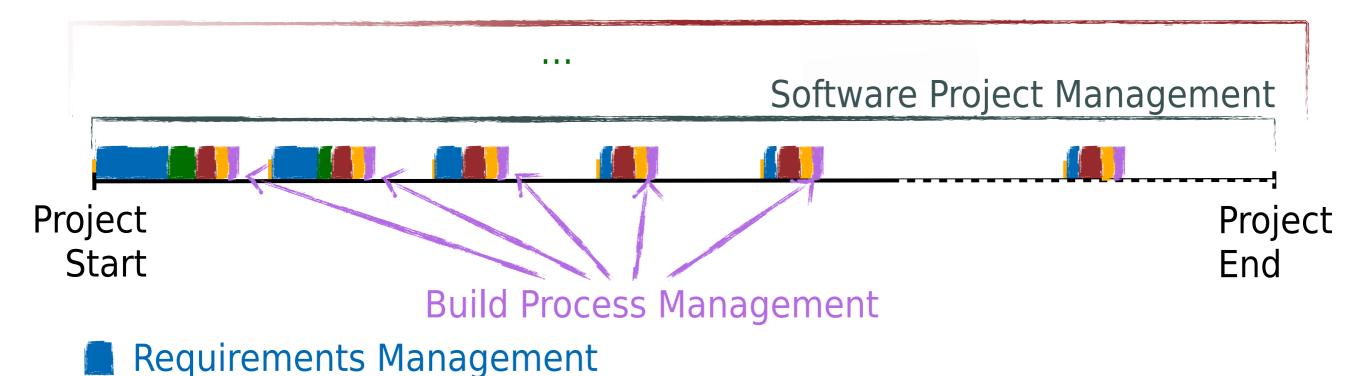

Summary

The goal of this lecture is to enable you to systematically carry out small(er) software projects that produce quality software.

- Projects are build using build tools
- A build script takes care of all steps necessary to build the project (In case of an application, building means creating a runnable application.)

The goal of this lecture is to enable you to systematically carry out small(er) commercial or open-source projects.
